Trials Register

The search options below provide access to the register of violence prevention outcome evaluation studies. To be included in the register, programmes or strategies must have the reduction of new acts of violence as an explicit objective. Included studies have been identified via funders of violence prevention research and direct communication with the violence prevention research community. Trials can be searched by violence type, keywords or country of implementation.

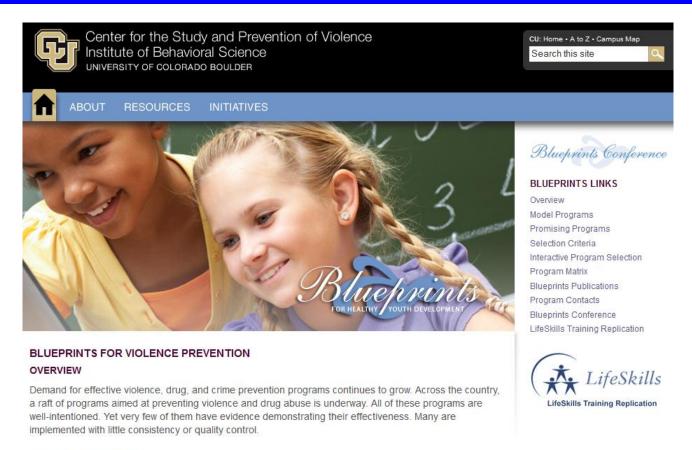

Violence Type		Country	
☐ Homicide	Elder Maltreatment	all countries	¥
Child Maltreatment	Suicide		
Youth Violence	Attempted Suicide		
Intimate Partner Violence	Self-harm		
Sexual Violence	Other		

Disclaimer: WHO, The Violence Prevention Alliance and the Centre for Public Health are not responsible for the accuracy, completeness and/or use made of the content displayed for any trial record, nor do they directly endorse any trial.

How do we know what works?

Blueprints for Violence Prevention, a project of the Center for the Study and Prevention of Violence at the University of Colorado, provide answers to that question. The Blueprints mission is to identify truly outstanding violence and drug prevention programs that meet a high scientific standard of effectiveness. In doing so, Blueprints serves as a resource for governments, foundations, businesses, and other organizations trying to make informed judgments about their investments in violence and drug prevention programs.

THE CAMPBELL COLLABORATION

What helps? What harms? Based on what evidence?

Home > What is a systematic review?

What is a systematic review?

The purpose of a systematic review is to sum up the best available research on a specific question. This is done by synthesizing the results of several studies.

A systematic review uses transparent procedures to find, evaluate and synthesize the results of relevant research. Procedures are explicitly defined in advance, in order to ensure that the exercise is transparent and can be replicated. This practice is also designed to minimize bias.

Studies included in a review are screened for quality, so that the findings of a large number of studies can be combined. Peer review is a key part of the process; qualified independent researchers control the author's methods and results.

A systematic review must have:

- Clear inclusion/ exclusion criteria
- An explicit search strategy
- Systematic coding and analysis of included studies
- Meta-analysis (where possible)

How do Campbell systematic reviews differ from other systematic reviews?

- Campbell reviews must include a systematic search for unpublished reports (to avoid publication bias).
- Campbell reviews are usually international in scope.
- A protocol (project plan) for the review is developed in advance and undergoes peer review.
- Study inclusion and coding decisions are accomplished by at least two reviewers who work independently and compare results.
- Campbell reviews undergo peer review and editorial review.
